

Medical Devices

The medical device industry has been pushing medicine into the future at a tremendous rate. The innovation surrounding medical devices have resulted in increased life-spans, the ability to provide better standards of care for the sick, and the availability of easier and more effective diagnostic and treatment options. From a technology perspective, medical devices cover a very wide spectrum of technical disciplines. Even a single medical device might involve multiple disparate technologies being used together. This is truly an area where engineering, and life sciences intersect.

Haley Guiliano has built a practice around addressing the intellectual property issues associated with medical devices. We bring together expertise from multiple engineering and science disciplines and apply our thorough understanding of the laws as applied to the medical device context. We also have in mind the regulatory processes and business considerations that are specific to the medical device industry in the work we do.
